

# Neural System Prediction and Identification Challenge

Ioannis Vlachos, Yury Zaytsev, Sebastian Spreizer, Arvind Kumar  
Neurobiology and Biophysics, Faculty of Biology, Bernstein Center Freiburg,  
University of Freiburg, Germany.

## Two main paradigms in neuroscience

1. Observation and analysis of neural activity while animals perform a sensory, motor or cognitive task.
2. Building models of brain function based on observed neural activity using methods from mathematics, physics, engineering and computer science.

The first approach assumes that recording the activity – and other properties – of more and more neurons under a variety of conditions will suffice to reveal the brain’s working principles. The second approach aims at integrating experimental findings in order to identify basic computational principles that the brain might be using.

## The problem

Despite decades of effort our understanding of brain processes has remained limited. **This makes one wonder if these approaches are indeed suitable to understand brain function.**

A decade and a half ago, Hopfield and Tank (Science 1986) argued that it is not sufficient to know all details of neurons and their connectivity to extract the function of a neural network. With growing computer power and the advancement of experimental methods that allow for increasing high-density sampling of neural activity, it seems that Hopfield and Tank’s message has been lost.

## The challenge of predicting function of neural systems from its activity

### nuSPIC-I: Discover the function of spiking neural network (SNN)

A particular function - [bio] logical, mathematical - is implemented in an SNN. Perform experiments and discover that function. All necessary information about neural properties and the connectivity matrix is provided.

### nuSPIC-II: Implement a given function using a finite number of spiking neurons

The screenshot displays the nuSPIC web interface. On the left, a table lists various devices with their parameters. The central part shows a network layout with nodes and connections. On the right, there are simulation controls and a results panel showing spike traces and membrane potentials. Callouts highlight features like 'Full information about the network', 'Changeable layout of the network', 'A number of input and output devices to stimulate and probe the network', and 'Comment your simulations'.

ID	Device	Targets	Weight (pA)	Delay (ms)
1	Neuron	11	100.0	0.1
2	Neuron	11	100.0	0.1
3	Neuron	11	100.0	0.1
4	Neuron	11	100.0	0.1
5	Neuron	11	100.0	0.1
6	Neuron	1,2,3,4,5	-1000.0	0.1
7	Neuron	1,2,3,4,5	-1000.0	0.1
8	Neuron	1,2,3,4,5	-1000.0	0.1
9	Neuron	1,2,3,4,5	-1000.0	0.1
10	Neuron	1,2,3,4,5	-1000.0	0.1
11	Neuron	1,2,3,4,5	-1000.0	0.1
12	Poisson Generator	1,2,3,4,5	1.0	1.0
13	Spike Generator	1,2,3,4,5,6,7,8...	1.0	1.0
14	Spike Detector	1,2,3,4,5,6,7,8...		
15	Voltmeter	1,2,3,4,5,6		

## Target audience

Neuroscientists  
Physicists  
Engineers  
Computer Scientists  
Hackers  
Brain enthusiasts  
Students  
You

## Features

- ◆ Known network connectivity, neuron and synapses properties
- ◆ Multiple devices to stimulate neurons
- ◆ Record spiking activity and membrane potential
- ◆ Save your previous simulation and offers a possibility to return to older simulations
- ◆ Simulation data can be downloaded as ascii files
- ◆ Basic data analysis tool. More sophisticated analysis can be provided on demand

## Goals

1. To determine if it is possible to extract a function from a small neural network given full knowledge of neural activity and connectivity. Which classes of networks can be easily extracted and which are rather difficult or even impossible, in principle, to handle?
2. To determine the specific strategies that users apply to extract the function of a network and to use the successful strategies for better experimental designs.
3. To determine the technical and theoretical constraints in the implementation of mathematical functions using a neural network of spiking neurons.

G-Node  
nest::  
simulated()
